

Use-Case Flow Specification : Submit Project and Receive Rubric Score

Preconditions:

- Student is logged into the system with a valid account
- Assignment submission window is open

Postconditions:

- Submission is stored in the system with a valid timestamp
- A rubric score breakdown is generated and associated with the submission, OR the submission is flagged as an execution error.
- If a faculty evaluator overrides the score, the updated score replaces the original for all future views.

Main Success Scenario:

1. The student selects a project .zip file and initiates upload.
2. The system validates the file and stores it with a submission timestamp.
3. The system automatically queues the submission for grading.
4. The system executes the preconfigured unit test suite against the submission.
5. The system generates an itemized rubric score breakdown.
6. The system stores the rubric breakdown linked to the submission.
7. Students view the rubric score breakdown.
8. The faculty evaluator reviews the auto-generated score.
9. Use case ends successfully.

Alternate Flow - 4a. Test Suite Execution Fails:

- 4a1. The system detects the test suite cannot execute (e.g., syntax error, missing files, corrupted zip).
- 4a2. The system flags the submission as "ungraded / execution error" instead of generating a rubric score.
- 4a3. The faculty evaluator is notified of the execution error.
- 4a4. The student is notified of the execution error status.
- 4a5. Use case ends without a score.

Alternate Flow - 8a. Faculty Overrides the Score:

- 8a1. The faculty evaluator determines the auto-generated score is incorrect.
- 8a2. The faculty evaluator manually adjusts the rubric score.
- 8a3. The system updates the stored score and marks it as faculty reviewed.
- 8a4. The student views the corrected score in place of the original.
- 8a5. Use case ends successfully.
